RESEARCH SUMMARY

ML Ph.D. candidate moving into **robot learning for humanoids**, and quick to become productive in a new field. I joined PIA Robotics, a pre-seed humanoid startup, with no prior robotics experience and within two months built its **full sim-to-real pipeline for humanoid whole-body control** from scratch: RL training in Isaac Lab, sim-to-sim validation in MuJoCo, and deployment on a real humanoid. I also built a text-to-robot motion pipeline that retargets generated human motion through **learned point-cloud correspondence**, trained **BeyondMimic motion-tracking** policies on it, and deployed them on the robot. My Ph.D. work used causal interventions on model internals (activation patching, steering, targeted post-training) to find where specific behaviors come from in LLMs and VLMs; before that, I trained in neuroscience. Seeking research roles in humanoid loco-manipulation and simulation.

EDUCATION

Ph.D. in Machine Learning, Georgia Institute of Technology

Anticipated 05/2027

B.S. in Neuroscience (Faculty Honors), Georgia Institute of Technology

RESEARCH EXPERIENCE

Research Intern, PIA Robotics

08/2026–present

Pre-seed humanoid startup · whole-body control and sim-to-real (Unitree G1)

- Built the company's **end-to-end sim-to-real pipeline** from scratch: RL training of whole-body control policies in Isaac Lab, sim-to-sim validation in MuJoCo, and deployment on hardware.
- Built a **text-to-robot motion pipeline**: motion generated from text with Kimodo (SOMA-RP-v1) on the SOMA body model, skinned into a human mesh with linear blend skinning, and retargeted to the G1 through **learned point-cloud correspondence** (PointNet autoencoder, following UMR) under contact, joint-limit, and floor constraints, instead of skeleton-based joint mapping.
- Trained **BeyondMimic motion-tracking policies** on the retargeted references and **deployed them on the G1**.
- Whole-body control policies from the sim-to-real pipeline run in the company's **teleoperated hardware demo**, in which the robot walks, squat-walks, and runs while staying balanced.

Research Intern, LG AI Research (Bio Intelligence Lab)

05/2026–08/2026

- Developed **DCCD-J**, a differentiable method for recovering causal graphs from interventional single-cell data under latent confounding and feedback loops, replacing the prior method's alternating covariance estimation, which collapses on real data, with a jointly optimized Cholesky parameterization; confounder-recovery F1 0.93 vs. 0.23. Co-first author, **NeurIPS 2026 Workshop on AI for Drug Discovery (AI4DD)**.
- Replaced expression-based variable selection with **attribution from single-cell foundation models** (scFoundation, scLong) to choose the gene set for regulatory inference.

Graduate Research Assistant (PI: C. S. Mitchell, Ph.D.)

08/2021–present

Laboratory for Pathology Dynamics, Georgia Tech & Emory University School of Medicine

- **[Telling Apart What Fine-Tuning Against Wrong Diagnostic Suggestions Gains and Loses]**
 - Showed that fine-tuning Llama-3.1-8B-Instruct (KL-regularized LoRA; also GRPO, and repeated on Qwen2.5-7B-Instruct) to resist wrong diagnostic suggestions raises accuracy under wrong ones (30.5% → 71.5%) but lowers it under correct ones (89.1% → 62.2%), and that what it loses is **the bias toward following suggestions, not discrimination** (AUROC 0.684 → 0.741).
 - Located the two changes at different tokens with **cross-model activation patching**, then **steered only the suggestion tokens** to recover 59% of the loss while keeping 79% of the discrimination gain, also on 951 held-out pairs.
 - *Under review at ACL Rolling Review (2026).*
- **[Goal-Aware LLM Alignment under Evidence and Eligibility Constraints]**
 - *Ongoing research project | 2026–present*
 - Built **counterfactual evaluations** of whether an LLM updates treatment-eligibility judgments when the rules change, but not when only the patient's stated goal changes.
 - Localized the failure to about 2% of attention heads with **activation patching** and post-train only those heads (SFT + RL with verifiable rewards), against budget-matched random-head and full-parameter baselines.

- **[Recovery Is Not Provenance: A Source-Substitution Audit of VLM Activation Patching in Medical VQA]**
 - Showed that activation patching that repairs a VLM's answer need not restore evidence from the image: with **source substitution**, which swaps the donor case while fixing the patch site, different-case donors reproduced 98–103% of same-case recovery across 5 VLMs.
 - *Under review at AAAI 2027.*
- **[Seven Medical Reasoning Biases, One Causal Direction]**
 - Found that one activation direction reduced cue-following across seven medical QA cue types and three LLM families; compared shared, cue-specific, and random directions to **separate what is detectable from what works as an intervention**.
 - *Under review at ACL Rolling Review (2026).*
- **[HiCo-EL: Encoding Ontology Structure into Bi-Encoder Entity Linking]**
 - Hierarchical contrastive pretraining that organizes each encoder space by the ontology's type hierarchy; +3.7% R@1 on MedMentions and **+9.6% R@1 on diseases unseen in training**. Supervised two junior researchers. EMNLP 2026.
- **Earlier work (2021–2025):** contributed to the lab's biomedical text-mining tools (CCS Explorer, TrialSieve, SemNet Explorer), with HiCo-EL as the entity-linking step; interpretable ML for cognitive assessment (first author, J. Clin. Med. 2025).

Computational Neuroscience Rotating Fellow (PI: C. Rozell, Ph.D.)

01/2021–05/2021

Department of Electrical Engineering, Georgia Tech

- Applied embedding-based similarity models and probabilistic latent-variable methods to characterize clinical depression phenotypes.

Undergraduate Research Fellow and ALS Team Lead (PI: C. S. Mitchell, Ph.D.)

12/2016–05/2020

Laboratory for Pathology Dynamics, Georgia Tech & Emory University School of Medicine

- Led ML-driven meta-analysis of heterogeneous preclinical datasets (>2,000 data points) and multi-scale dynamical-systems models of ALS.
- Led an NIH grant and a team of 5 researchers, resulting in 9 publications.

SKILLS

- **Robotics:** Isaac Lab, MuJoCo; RL for humanoid whole-body control and motion tracking (BeyondMimic); sim-to-sim and sim-to-real transfer on a Unitree G1; text-to-motion generation (Kimodo, SOMA); correspondence-based motion retargeting (linear blend skinning, PointNet autoencoder, UMR).
- **Machine learning:** Python, PyTorch, HuggingFace, Accelerate, DeepSpeed, multi-GPU training, W&B, MATLAB, R; SFT, GRPO (RL with verifiable rewards), LoRA; activation patching and causal interventions; controlled evaluation design.
- **Languages:** Native in Korean; fluent in English.

TEACHING EXPERIENCE

Graduate Teaching Assistant, Georgia Tech, Dept. of Biomedical Engineering

Summer 2025

- Graded homework, held weekly office hours, and reviewed concepts for BMED2400 (Bioengineering Statistics).
- Nominated for departmental award recognizing outstanding teaching and mentorship.
- Supervised two junior researchers on HiCo-EL through to an EMNLP 2026 acceptance.

HONORS / FELLOWSHIPS

BME Department Outstanding Teaching & Mentorship Award — Nominee	2025
National Science Foundation Graduate Research Fellowship — Honorable Mention	05/2020
NIH T32 Training Fellowship in Computational Neuroengineering	05/2020
President's Undergraduate Research Project Award	
President's Undergraduate Research Travel Award	10/2017
Zell Miller Scholarship (full-tuition merit-based scholarship)
